Predpovedny datum:

```
T_\ell=\begin{cases}t+15\ell\text{ dni}, &
\ell=od,1,do,6,\\t\oplus(\ell-3)\text{ mesic}, &
\ell=od,7,do,27\end{cases}
```

Copy

$$T_\ell = \begin{cases} t + 15\ell \text{ dni}, & \ell = od, 1, do, 6, \\ t \oplus (\ell - 3) \text{ mesic}, & \ell = od, 7, do, 27 \end{cases}$$

Pro komoditu “i” se zvoli kontrakt s nejblizsi expiraci:

```
E_{i,\ell}=\underset{E\in\mathcal E_i}{\arg\min}\left|E-
T_\ell\right|
```

Copy

$$E_{i,\ell} = \underset{E \in \mathcal{E}_i}{\arg\min} |E - T_\ell|$$

\mathcal E_i = dostupne datumy expirace

Kdyz neexistuje potrebny kontrakt (casove), je poreba vizt kontrakty se sousedni expiraci:

```
E^-_{i,\ell}\leq T_\ell\leq E^+_{i,\ell}
```

Copy

$$E^-_{i,\ell} \leq T_\ell \leq E^+_{i,\ell}$$

Koeficient interpolace:

```
\omega_{i,\ell}=\frac{T_\ell-E^-_{i,\ell}}{E^+_{i,\ell}-E^-_{i,\ell}}
```

Copy

$$\omega_{i,\ell} = \frac{T_\ell - E^-_{i,\ell}}{E^+_{i,\ell} - E^-_{i,\ell}}$$

Umela cena pro presny datum:

```
\ln \widehat P^{fut}_{i,t}(T_\ell)=(1-\omega_{i,\ell})\ln\widehat
P^{fut}_{i,t}(E^-_{i,\ell})+\omega_{i,\ell}\ln\widehat
P^{fut}_{i,t}(E^+_{i,\ell})
```

Copy

$$\ln \widehat{P}^{fut}_{i,t}(T_\ell) = (1-\omega_{i,\ell}) \ln \widehat{P}^{fut}_{i,t}(E^-_{i,\ell}) + \omega_{i,\ell} \ln \widehat{P}^{fut}_{i,t}(E^+_{i,\ell})$$
